A Splendid American Conifer

*Abies fraseri, True Fraser's Fir*

Specimen Fraser's Fir on Grounds of Highlands Nursery
Absolutely hardy. Makes a fine windbreak
Abies fraseri
THE TRUE FRASER’S FIR

The northern species, Abies balsamea, is almost worthless in any but the latitude of middle and northern Maine, as it becomes “leggy,” thin, and is short-lived.

Fraser’s Fir, however, is a distinct species from the highest peaks of the Carolina mountains, and makes a perfect specimen lawn and screen tree, with dark green, thick-set foliage (blue underneath) and compact, pyramidal habit. It is one of the choicest of all American conifers of the Fir section.

A New American Rhododendron

*R. carolinianum*

Specimen plant supplied by Highlands Nursery. Flowers clear pink without the slightest tinge of magenta
Rhododendron carolinianum
A New American Species
Clear Pink       Absolutely Hardy

The smallest Alleghanian species; attains 6 to 8 ft. in cultivation. Leaves dark green, usually blunt and narrow, covered with rusty dots below; much smaller than either maximum or catawbiense. Flower-clusters appear in greatest profusion in June, covering the plant with a rose-colored mantle. Fine for rocky slopes or hillsides, standing exposure unusually well, and invaluable as a single specimen or for massing with the other species. Until this year we have been sending this beautiful and rare species out under the name of punctatum. Professor Sargent has recently called attention to the fact that it is a distinct species from the punctatum, differing in time of bloom, with more showy and profuse flowers, and making a much larger and finer plant than the true punctatum.

It is now known as Rhododendron carolinianum, being described and named by Alfred Rehder, Arnold Arboretum, Jamaica Plain, Mass.
